

# PLATES AND TRAYS

## FOR CAKES AND PASTRIES

Die-cut compact cardboard that has a protective plastic layer, to make it suitable for direct food contact. It can be used as a base or support for all kind of foodstuffs.

### Customisation possibilities

Wide range of shapes

Personalise the product with any colour and adapt the weight (grsm)

Can be thermoformed

Can be printed (by flexography or by offset printing)

# A GREAT IDEA TO IMPROVE FOOD SAFETY

## NON-METALLIC GOLD AND SILVER

### WHY?

With the objective to improve food safety in industrial processes, manufacturers are increasingly pushed to adopt metal detection technologies. These technologies can entail problems when using gold- or silver-plated cardboards or bases.

### THE SOLUTION

These problems can be avoided by using laminates that have not been manufactured with metallic particles. Thanks to these new formulas, it is possible to keep using the popular golden and silver colours without loss of quality and without issues with metal detection technologies. The optimal laminate for each client will depend upon the metal detection technology and the colour hue used by each particular client.

I+D+I

Our innovation is focused in solving our client's present and future needs.
