

Food forest De Vergroening

My dream is for us, human beings, to live in symbiosis with Mother Nature.

A food forest contributes enormously to this.

The resulting abundance nourishes all life.

Paradise is already here, we just need to let it be.

Mischa Frijns

Winter 2023 2024

Currently, the preparation of the food forest is in full swing. That is, we are further developing the design to scale in detail.

The design now shows how wide and with which species (>19) the wind hedge will be realised. More than 2,000 will be planted this winter. This in collaboration with Regional Landscape and the National Orchard Foundation. Provided there is sufficient stock...

The 'swales' have also been drawn in after being laser-measured in the plot. These swales, especially in the initial phase, have an important role; water management!

Purpose

By creating a food forest we are able to “give back” to our mother Earth. In this way we create a safe place for many birds, bees, insects and more wild life. The soil and thus the soil life will flourish by letting it be, this means no external input of whatever. In this way the soil will be restored and all plants, trees and so on will be provided for via the mycelium. In return the food forest does not only takes care of the wild life, it creates more clean air, stores carbon into the soil and it will provide food.
